

Force DNS change.

In my case, `/etc/resolved.conf` was a symlink pointing to `/run/systemd/resolve/stub-resolv.conf`. I could edit both but they reverted to default after a reboot.

So I did `cp "/etc/resolv.conf" "/etc/resolv.conf_ORIGINAL"` And edited it to my liking. For example:

```
#nameserver 127.0.0.53
nameserver 94.140.14.14#adguard
nameserver 94.140.15.15#adguard
options edns0 trust-ad
search .
```

Then I `chattr +i /etc/resolv.conf` to prevent any unwanted modification.

To undo, just `chattr -i /etc/resolv.conf`

Install dig to check:

```
sudo apt install dnsutils
```

```
dig google.com
```
