

How to run Bashtop on Debian

To install :

Bashtop is available in [Azlux's repository](#) as well as [Debian repository](#) and all you need is to download the Debian package and install it as shown:

```
$ wget http://packages.azlux.fr/debian/pool/main/b/bashtop/bashtop_0.9.25_all.deb  
  
$ sudo dpkg -i bashtop_0.9.25_all.deb
```

Bashtop - A nifty resource monitor

To run, just run :

```
bashtop
```

To uninstall :

```
sudo apt-get remove bashtop
```

If you want to remove the package and its dependencies that are no longer needed, you can use the following command:

```
sudo apt-get remove --auto-remove bashtop
```

Finally, to remove any dependencies that were installed with `bashtop`, run the following command:

```
sudo apt autoremove
```

It's always a good idea to double-check the name of the package you want to remove before running the command to avoid accidentally removing the wrong package. You can use the `dpkg -l` command to list all installed packages on your system.
